

Abstract of the Disclosure

A system and method for monitoring performance information is provided whereby a number of sites are connected to a server via a communications network. An IT tool residing on the server provides forms via which each site submits the performance information to a plurality of databases by an area of interest. As the information is entered, it is monitored for conformance against the pre-established performance criteria set by the program administrator in the system so that at any given time, a report can be generated as a function of currently stored data. Nonconformance is flagged and notification is sent to the appropriate parties in a position to remedy the nonconformance.
